

# LESS LABOR. LESS TIME.

WHAT MORE COULD YOU ASK FOR?

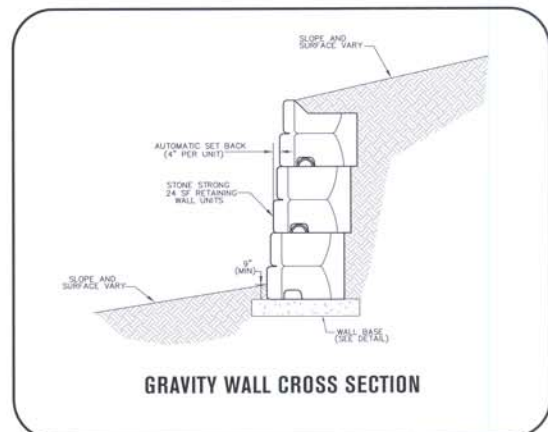

# WITH STONE STRONG, INSTALLATION IS FAST AND EASY

These big blocks are a big improvement. Not only does Stone Strong® make efficient use of your existing equipment, it eliminates the intense labor required to assemble small block retaining walls. Nothing else even comes close.

## BENEFITS TO CONTRACTORS/INSTALLERS

- A three-man crew and a couple pieces of equipment can lay up to 1,200 square feet of block a day.
  - No extensive digging for structural tieback or gravel backfill.
  - The sheer size and weight of the blocks holds the system together to create a rock-solid gravity wall.
  - Walls can reach heights of up to 21-feet without geo-grid reinforcement (depending on site and soil conditions). With proper engineering, walls can reach heights of 40-feet.
  - Cast-in place galvanized rebar handles make it easy to hoist the blocks and act as alignment pins for stacking successive lifts.
  - No drainage system to install. This is the only wall system with a built-in drainage system requiring no additional parts or labor.
  - Blocks interlock precisely and securely without any mechanical assistance. The stone infill in the block provides a 100% efficient connection strength.
  - Unlike traditional gravel backfill, the stone infill can be easily estimated.
  - The tapered sides of the blocks make it easy to create both straight and winding designs—even convex, concave, and circular designs.
  - Stone Strong Systems provides a new business niche. Larger blocks require larger equipment, essentially narrowing the field for bidding projects.
  - The ability to create nearly vertical walls allows you to install an attractive wall in places where only poured concrete was possible before.
  - The innovative hollow design means less weight per square foot. Less weight means more product can be delivered to the job for faster installation.
  - These are the only blocks to be both structurally and geo-technically engineered—so you can be assured you are installing a high performance product.
- Unlike other brands, returned concrete is never used in Stone Strong blocks—resulting in a controlled specified product throughout the job.
